

Airbrush Tanning BRONZE + DARK :

Nederlands :

Airbrush Tanning Lotions:

Airbrush Tanning lotion bevat het actieve ingrediënt DHA dat voorkomt in de meeste tanning producten. DHA of Dihydroxy Aceton is een chemisch product dat reageert met de aminozuren in de opperhuid en die bruin doet verkleuren. DHA wordt al meer dan 30 jaar veilig gebruikt in cosmetica..

Airbrush Tanning lotion is beschikbaar in 2 soorten : Bronze en Dark.

Bronze lotion zorgt voor een onmiddellijke bruining van de huid en heeft +- 5 uur nodig om zich volledig te ontwikkelen. Bronze lotion kan aangebracht worden op ieder type huid.

Dark lotion wordt enkel aangebracht op een huid die al voorzien is van een basisbruining - een natuurlijke afkomstig van de zon of een eerder aangebrachte bruining met Bronze lotion..

Airbrush Tanning :

Na het reinigen van de huid wordt met een airbrush de tanning lotion rechtstreeks op de huid gespreid. Een behandeling van 10 - 15 minuten garandeert een perfect eindresultaat. De finale kleuring wordt bereikt na +- 5 uur. De airbrushbehandeling garandeert een mooie egale kleur zonder strepen of vlekken.

Een eerste behandeling zal +- 10 dagen zichtbaar blijven, afhankelijk van huidtype en verzorging. Door middel van nabehandelingen kan de kleuring behouden blijven voor langere tijd (gebruikmakend van Tanning Lotion Dark)

Airbrush Tanning lotions Bronze en Dark bevatten geen zonneprotectors, maar kunnen wel gebruikt worden in combinatie met normale zonneprotectors en cremes.

Eén Airbrush Tanning behandeling zal al een uitstekende basiskleur geven voorafgaand aan een normaal zonnebad. Normale zonnebaden kunnen dan korter - en dus veiliger - genomen worden om tot een mooie bruine en langdurige kleur te komen.

De Engelstalige versie op de volgende bladzijden geeft een meer gedetailleerde beschrijving van de procedure.

English :

Airbrush Tanning Lotions:

Airbrush Tanning lotions contain the active ingredient DHA that is found in the majority of tanning products. DHA or Dihydroxy Acetone is a chemical that reacts with amino acids in the uppermost layer of the skin and causes them to turn brown. DHA has been used safely in cosmetics for over 30 years.

Airbrush Tanning lotion is available in two forms, Dark and Bronze:

Bronze lotion contains a colouring agent for customers who want an instant tan effect. The full tan effect will develop over 5 hours.

We have recently introduced a 'Dark Tan' lotion to our range. This lotion is excellent for deepening and prolonging an existing base tan, but should not be used on pale skin.

Airbrush Tanning explained

Following exfoliation, an airbrush is used to spray an exact combination of air and tanning lotion directly onto the skin. A 10 -15 minute treatment will achieve a flawless tan that develops over a period of 5 hours.

One initial tan will last up to 10 days, depending on skin type and care. Top up sessions are offered to clients as and when they are needed. The speed combined with proven results of the treatment ensures regular customers and fantastic profitability for your business.

Airbrush Tanning lotion contains no sunscreens, but can be used in conjunction with normal sunbathing provided sun protection cream is used at all times.

One Airbrush Tanning treatment will give an excellent base colour prior to sun bathing. Normal sunbathing can then be undertaken at a slower, safer pace with higher protection factor sunscreen. The result is a deeper, longer lasting, healthier suntan.

Here is how to proceed in detail :

Preparation : Clients should exfoliate thoroughly either the day before or on the day of tanning. Moisturising on the day of the airbrushtanning should be avoided. If necessary use very light , non-oil based products and remove prior to application of the tan. Shaving and preparation of the bikini line should be done the day before to give pores time to close. Deodorant and perfume must be avoided on the tanning day as they react with the tanning lotion. All make-up must be removed if the face is to be tanned. Airbrush Tanning lotion does not stain hair or lips.

Clothing :

For full body tans, clients may choose to wear a bikini or bra and pants. For partial tanning, clothing should be worn that gives access to those areas which need to be tanned. Airbrush Tanning lotion will wash out on natural fabrics but not on synthetics. During and after the treatment please wear dark clothing that will not show the fine brown overspray or clothing that you do not mind being discoloured.

Leaving the salon :

Customers are advised to wear dark, loose fitting clothing when leaving the salon. Traces of the tanning solution can be transferred onto the clothing and bed sheets unless a shower has been taken 5 hours or more after the application.

Developing the tan :

Airbrush tanning lotion takes 5 hours to develop its full colour strength. All bathing, showering, swimming and vigorous exercise must be avoided at least 5 hours after receiving the airbrush tan. Small amounts of colour may be washed from the skin during bathing but this does not spoil the tan.

Maintaining the tan :

With regular moisturising your tan will last up to 10 days depending on skin type, skin care and bathing routine. A full exfoliation on day 4 is recommended , followed by a 'top-up-tan' to achieve the perfect tropical tan.

Sunscreen :

Airbrush tanning lotion offers no protection from the sun. High factor sunscreens and regular moisturising are always recommended when sitting for prolonged periods in the sun.

Contra-indications :

Tan should not be offered to clients who have psoriasis, eczema, cuts or abrasions. Must not be used during the first trimester of pregnancy due to melanin changes in the skin.

Dark Tan solution :

The Airbrush Tanning lotion DARK must only be used by those who already have a good base tan or who tan very easily.

Caution should be observed when using the Dark Tan solution as the higher DHA content may cause skin irritation. A patch test is highly recommended prior to full tan treatment.
